Chapter 1

Homology

1.1 Introduction

These are lecture notes for the 2014 Part III Algebraic Topology course taught by Dr. Jacob Rasmussen.

The recommended books are:

- Algebraic Topology Allen Hatcher,
- Homology Theory James W. Vick,
- Differential Forms in Algebraic Topology Raoul Bott and Loring W. Tu.

1.2 Homotopy

1.2.1 Homotopies

Definition 1.2.1 (Homotopic maps). Maps $f_0, f_1: X \to Y$ are said to be **homotopic** if there is a continuous map $F: X \times I \to Y$ such that

$$F(x,0) = f_0(x)$$
 and $F(x,1) = f_1(x) \ \forall x \in X$.

We let $\operatorname{Map}(X,Y) = \{f : X \to Y \text{ continuous}\}$. Then letting $f_t(x) = F(x,t)$ in the above definition we see that f_t is a path from f_0 to f_1 in $\operatorname{Map}(X,Y)$.

Example 1.2.2. 1. $X = Y = \mathbf{R}^n$, $f_0(\overline{x}) = \overline{0}$ and $f_1(\overline{x}) = \overline{x}$ are homotopic via $f_t(\overline{x}) = t\overline{x}$.

- 2. $S^1 = \{z \in \mathbf{C} : |z| = 1\}$ then
- 3. $S^n = {\overline{x} \in \mathbf{R}^n : |\overline{x}| = 1}$

Lemma 1.2.3. Homotopy is an equivalence relation on Map(X,Y).

Lemma 1.2.4. If $f_0 \sim f_1 : X \to Y$ and $g_0 \sim g_1 : Y \to Z$ then $g_0 \circ f_0 \sim g_1 \circ f_1$.

Corollary 1.2.5. For any space X the set $[X, \mathbb{R}^n]$ has one element.

Proof. Define
$$0_X: X \to \mathbf{R}^n$$
 by $0_X(x) = 0 \in \mathbf{R}^n$ for any $x \in X$.

Definition 1.2.6 (Contractible space). X is **contractible** if 1_X is homotopic to a constant map.

Proposition 1.2.7. Y is contractible \iff [X,Y] has one element for any space X.

Proof. (\Rightarrow) as in corollary. (\Leftarrow) [X, Y] has one element so $1_Y \sim$ a constant map. \square

Given a space X how can we tell if X is contractible? If X is contractible then it must be path connected for one.

Proof. Contractible implies that $[S^0, X]$ has one element and so $f: S^0 \to X$ extends to D^1 , and therefore X is path connected.

Similarly if $[S^1, X]$ has more than one element then X is not contractible.

Definition 1.2.8 (Simply connected). We say X is **simply connected** if $[S^1, X]$ has only one element.

We say two space X and Y are homotopy equivalent if there exists $f: X \to Y$ and $g: Y \to X$ such that $g \circ f \sim 1_X$ and $f \circ g \sim 1_Y$.

Example 1.2.9. X is contractible if and only if $X \sim \{p\}$.

Proof. X contractible $\Longrightarrow 1_X \sim c$, a constant map. Choose $f: X \to \{p\}$, f(x) = p and $g: \{p\} \to X$, g(p) = c. Then $g \circ f = c \sim 1$ and $f \circ g = 1_{\{p\}}$. Converse: exercise.

Exercise 1.2.10.

Given X and Y how can we determine if $X \sim Y$? How do we determine [X,Y]? For example is $S^n \sim S^m$.

1.2.2 Homotopy groups

Definition 1.2.11 (Map of pairs). A map of pairs $f: (X, A) \to (Y, B)$ is a map $f: X \to Y$ with sets $A \subset X$ and $B \subset Y$ such that $f(A) \subset B$.

If we have maps of pairs $f_0, f_1: (X, A) \to (Y, B)$ then we write $f_0 \sim f_1$ if there exists $F: (X \times I, A \times I) \to (Y, B)$ such that $F(x, 0) = f_0(x)$ and $F(x, 1) = f_1(x)$.

Definition 1.2.12 (Homotopy groups). If $* \in X$ then the *n*th homotopy group is

$$\pi_n(X,*) = [(D^n, S^{n-1}) \to (X, \{*\})].$$

We now note several properties of this definition:

- 1. $\pi_0(X,*) = \text{set of path components of } X.$
- 2. $\pi_1(X,*)$ is a group. $\pi_n(X,*)$ is an abelian group.
- 3. π_n is a functor

So given

$$f\colon (X,p)\to (Y,q)$$

we get

$$f_* \colon \pi_n(X, p) \to \pi_n(y, q)$$

defined by

$$f_*(\gamma) = f \circ \gamma.$$

$$n$$
 1 2 3 4 5 6 7 $\pi_n(S^2)$ 0 **Z Z** $\mathbb{Z}/2$ $\mathbb{Z}/2$ $\mathbb{Z}/12$ $\mathbb{Z}/15$

Example 1.2.13 (Homotopy groups of S^2).

1.3. HOMOLOGY 3

1.3 Homology

Our goal is to construct a functor H_* from the category of topological spaces and continuous maps to the category of **Z**-modules and **Z**-linear maps. This means to each space X we associate an abelian group $H_*(X) = \bigoplus_{n \geq 0} H_n(X)$, and to each map $f: X \to Y$ a function $f_*: H_n(X) \to H_n(Y)$ satisfying $(1_X)_* = 1_{H_n(X)}$ and $(f \circ g)_* = f_* \circ g_*$.

Some properties we would like to have for our construction are:

- 1. Homotopy invariance, if $f \sim g \colon X \to Y$ then $f_* = g_*$.
- 2. The dimension axiom, $H_n(X) = 0$ for any $n > \dim X$.

1.3.1 Chain complexes

Definition 1.3.1 (Chain complex). If R is a commutative ring then a **chain complex** over R is a pair (C, d) satisfying:

- 1. $C = \bigoplus_{n \in \mathbb{Z}} C_n$ for R-modules C_n .
- 2. $d: C \to C$ where $d = \bigoplus d_n$ for R-linear maps d_n .
- 3. $d \circ d = 0$.

The indexing by n is called a **grading**. Usually we take $C_n = 0$ for n < 0. An element of ker d_n is called **closed** or a **cycle**. An element of im d_n is called a **boundary**. d is the **boundary map** or **differential**.

Definition 1.3.2 (Homology groups). If (C, d) is a chain complex, its nth homology group is

$$H_n(C,d) = \ker d_n / \operatorname{im} d_{n+1}.$$

If $x \in \ker d_n$ we write [x] for its image in $H_n(C)$.

Example 1.3.3. 1. $C_0 = C_1 = \mathbf{Z}$, $C_i = 0$ otherwise,

$$0 \to \mathbf{Z} \xrightarrow{\cdot 3} \mathbf{Z} \to 0.$$

Then $H_1 = 0$, $H_0 = \mathbf{Z}/3$.

2.

$$\mathbf{Z}=\langle e\rangle \to \mathbf{Z}^2=\langle f_1,f_2\rangle \to \mathbf{Z}=\langle g\rangle \to 0$$
 with $d(e)=f_1-f_2,\, d(f_1)=d(f_2)=g,$ then $H_*(C)=0$ (exercise).

1.3.2 The chain complex of a simplex

Definition 1.3.4 (n-simplex). The n-dimensional simplex Δ^n is

$$\Delta^n = \left\{ (x_0, \dots, x_n) \in \mathbf{R}^n : \sum_i x_i = 1, \ x_i \ge 0 \forall i \right\}.$$

 Δ^n has **vertices** v_0, \ldots, v_n which are the intersections with the coordinate axes. The k-dimensional **faces** are in bijection with the k + 1 element subsets of $\{0, \ldots, n\}$.

Definition 1.3.5 (Simplicial chain complex). $S_*(\Delta^n)$ is the chain complex with $S_k(\Delta^n)$ the free **Z**-module generated by the k-dimensional faces of Δ^n . So

$$S_k(\Delta^n) = \langle e_I : I = \{i_0, \dots, i_k : 0 \le i_0 \le \dots \le i_k \le n\} \rangle.$$

To define d it suffices to define $d(e_I)$, we let

$$d(e_I) = \sum_{i=0}^{k} (-1)^j e_{i_0,\dots,i_{j-1},i_{j+1},\dots,i_k} \in S_{k-1}(\Delta^n).$$

Example 1.3.6. 1. For Δ^1 we have $d(e_{0,1}) = e_1 - e_0$.

2. For Δ^2 we have $d(e_{0,1,2}) = e_{12} - e_{02} + e_{01}$ and so $d^2(e_I = (e_2 - e_1) - (e_2 - e_0) + (e_1 - e_0) = 0$.

Lemma 1.3.7. $d^2 = 0$

Proof. It suffices to show $d^2(e_I) = 0$ for all I.

$$d^{2}(e_{I}) = d \left(\sum_{j=0}^{k} (-1)^{j} e_{i_{0},...,\hat{i}_{j},...,i_{k}} \right)$$

$$= \sum_{j=0}^{k} (-1)^{j} d \left(e_{i_{0},...,\hat{i}_{j},...,i_{k}} \right)$$

$$= \sum_{j=0}^{k} (-1)^{j} \left(\sum_{l < j} (-1)^{l} e_{i_{0},...,\hat{i}_{l},...,\hat{i}_{j},...,i_{k}} + \sum_{l > j} (-1)^{l-1} e_{i_{0},...,\hat{i}_{j},...,\hat{i}_{l},...,i_{k}} \right)$$

$$= \sum_{j=0}^{k} \left(\sum_{l < j} (-1)^{l+j} e_{I-i_{l}-i_{j}} - \sum_{l > j} (-1)^{l+j} e_{I-i_{j}-i_{l}} \right) = 0.$$

Example 1.3.8 (Computing $H_*(S_*(\Delta^2))$).

$$0 \to \mathbf{Z} = \langle e_{012} \rangle \to \mathbf{Z}^3 = \langle e_{01}, e_{02}, e_{12} \rangle \to \mathbf{Z}^3 = \langle e_0, e_1, e_2 \rangle \to 0$$

with $d(e_{012}) = e_{12} - e_{02} + e_{01}$. So $\ker d_2 = 0 \implies H_2 = 0$.

$$d(ae_{01} + be_{02} + ce_{12}) = a(e_1 - e_0) + b(e_2 - e_1) + c(e_2 - e_0)$$

so $ae_{01} + be_{02} + ce_{12} \in \ker d_1 \iff -a - b = 0, \ a - c = 0, \ c + b = 0 \iff a = -b = c \text{ hence } \ker d_1 = \langle e_{01} - e_{02} + e_{12} = \operatorname{im} d_2 \text{ and so } H_1 = 0. \operatorname{ker}(d_0) = 0, \operatorname{im} d_1 = \langle e_1 - e_0, e_2 - e_1, e_2 - e_0 \rangle \text{ so } H_0 = \mathbf{Z} = \langle [e_0] \rangle.$

Exercise 1.3.9. Show that $H_*(S_*(\Delta^n)) = 0$ if $k \neq 0$ and **Z** if k = 0.

1.3.3 The singular chain complex

Definition 1.3.10 (Singular chain complex). If X is a space, the **singular chain** complex of X, $C_*(X)$ is defined by

$$C_n(x) = \langle e_{\sigma} : \sigma : \Delta^n \to X \text{ any continuous map} \rangle.$$

Where

$$d(e_{\sigma}) = \sum_{j=0}^{n} (-1)^{j} e_{\sigma \circ F_{j}} \in C_{n-1}(X)$$

where $F_j: \Delta^{n-1} \to \Delta^n$ is given by $F_j(x_0, \ldots, x_{n_1} = (x_0, \ldots, 0, \ldots, x_{n-1}))$ with the 0 in the jth place.

1.3.3.1 Homotopy invariance

Definition 1.3.11 (Chain homotopic maps). Suppose $\phi, \psi \colon C_* \to C'_*$ are chain maps, we say that ϕ are **chain homotopic** if there exists an R-linear map $h \colon C_* \to C'_{*+1}$ such that $d' \circ h + h \circ d' = \phi - \psi$. We denote this relation by $\phi \sim \psi$.

Lemma 1.3.12. If $\phi \sim \psi$ then $\phi_* = \psi_*$.

Proof.

$$\phi_*([x]) - \psi_*([x]) = [\phi(x) - \psi(x)]$$

= $[d'hx + hdx] = [d'hx] = 0 \in H_*(C').$

Theorem 1.3.13. Suppose $f \sim g \colon X \to Y$ via H then $f_{\#} \sim g_{\#} \implies f_* = g_*$.

Proof.

Corollary 1.3.14. If $X \sim Y$ then $H_*(X) \cong H_*(Y)$.

Corollary 1.3.15. If X is contractible then $H_*(X) \cong H_*(\{p\}) \cong \mathbf{Z}$ if *=0, 0 otherwise.

1.4 Homology of a pair

1.4.1 Exact sequences

Definition 1.4.1 (Exact sequence). A sequence

$$\cdots \to A_{n+1} \to A_n \to A_{n-1} \to \cdots$$

of R-modules and R-linear maps is **exact** at A_n if $\ker f_n = \operatorname{im} f_{n+1}$. A sequence is **exact** if it is exact at all A_n , then (A_*, f) is known as a **acyclic** chain complex (the homology is zero).

Example 1.4.2. 1. $0 \to A \xrightarrow{f} B$ is exact if and only if f is surjective.

- 2. $B \xrightarrow{g} C \to 0$ is exact if and only if g is injective.
- 3. $0 \to A \xrightarrow{f} A' \to 0$ is exact if and only if f is an isomorphism.
- 4. $0 \to A \to B \to C \to 0$ is exact if and only if $A \subset B$ and $C \cong B/A$.

Definition 1.4.3 (Short exact sequence). A sequence

$$0 \to A_* \xrightarrow{i} B_* \xrightarrow{\pi} C_* \to 0$$

is a **short exact sequence** of chain complexes if

- 1. A_*, B_*, C_* are chain complexes.
- 2. i, π are chain maps.

3.

$$0 \to A_n \xrightarrow{i} B_n \xrightarrow{\pi} C_n \to 0$$

is exact for all n.

Lemma 1.4.4 (Snake lemma). If

$$0 \to A_* \xrightarrow{i} B_* \xrightarrow{\pi} C_* \to 0$$

is a short exact sequence of chain complexes then there is an associated **long exact** sequence of homology groups

$$\cdots \longrightarrow H_n(A) \longrightarrow H_n(B) \longrightarrow H_n(C)$$

$$\xrightarrow{\partial_n}$$

$$H_{n-1}(A) \longrightarrow H_{n-1}(B) \longrightarrow H_{n-1}(C) \longrightarrow \cdots$$

The map ∂ is called the **boundary map** in the exact sequence.

Proof. We first define ∂ , given $[c] \in H_n(C)$ pick $b \in B_n$ such that $\pi(b) = c$. Now $\pi db = d\pi b = dc = 0$ and so db = ia for some $a \in A_{n-1}$. We have that ida = dia = ddb = 0 and so da = 0 and we can define $\partial[c] = [a] \in H_{n-1}(A)$. We must check that the definition of ∂ does not depend on the choice of b or c and also check exactness at each term. Here we prove exactness at $H_n(C)$. With notation as above suppose $[c] = \pi_*([x])$ then we can take b = x, db = 0 implying that a = 0 and so $\partial[c] = [a] = 0$. We have then that im $\pi_* \subset \ker \partial$, so it remains to show that $\ker \partial \subset \operatorname{im} \pi_*$. If [a] = da', $a' \in A_n$ we let b' = b - i(a') then d(b') = db - d(ia') = db - i(da') = db - db = 0. Then $[b'] \in H_n(B)$ so $\pi_*([b']) = [\pi(b')] = [\pi(b) - \pi(i(a'))] = [\pi(b)] = [c]$.

Exercise 1.4.6. Suppose we have a map of short exact sequences commuting, then show there is a map of long exact sequences of homology commuting.

Example 1.4.7 (Reduced homology). If X is a space let

$$\tilde{C}_*(X) = \begin{cases} C_*(X), & * \neq -1, \\ \mathbf{Z}, & * = -1, \end{cases}$$

then define $d(e_p) = e$ for $p \in X$. We have $d^2e_{\gamma} = d(e_{\gamma(1)} - e_{\gamma(0)}) = e - e = 0$. So \tilde{C}_* is a chain complex.

This construction can be motivated by thinking of $\Delta^{-1} = \{\}$ and then considering $\operatorname{Map}(\{\}, X) = \{e\}$. If

$$A_* = \begin{cases} \mathbf{Z} = \langle e \rangle, & * = -1, \\ 0, & * = -1. \end{cases}$$

Then we have a short exact sequence

$$0 \to A_* \to \tilde{C}_*(X) \to C_*(X) \to 0.$$

We have $H_*(A) = A_*$ and so the long exact sequence of homology then says that for $n \ge 0$

$$\cdots \to H_n(A) = 0 \to H_n(\tilde{C}(X)) \to H_n(C(X)) \to H_{n-1}(A) = 0 \to \cdots$$

giving that $H_n(\tilde{C}_*(X)) \cong H_n(C_*(X))$ for n > 0. We write $\tilde{H}_*(X)$ for $H_*(\tilde{C}_*(X))$. At n = 0 we get

$$\cdots \to 0 \to \tilde{H}_0(X) \to H_0(X) \to \mathbf{Z} \to 0 \to \cdots$$

giving that $\tilde{H}_0(X)$ has one fewer copies of **Z** than $H_0(X)$.

Example 1.4.8 (Homology of a pair). Suppose $A \subset X$, then $C_*(A) \subset C_*(X)$ is a subcomplex. Define $C_*(X,A) = C_*(X)/C_*(A)$ and so we have a short exact sequence

$$0 \to C_*(A) \to C_*(X) \to C_*(X, A) \to 0.$$

1.4.2 Homology of a pair

Definition 1.4.9 (Homology of a pair). $H_*(X, A) = H_*(C_*(X, A))$ is the **homology of the pair** (X, A).

From this we obtain:

Definition 1.4.10 (Long exact sequence of a pair). The **long exact sequence of** the pair (X, A) is

$$\cdots \to H_n(A) \to H_n(X) \to H_n(X,A) \xrightarrow{\partial} H_{n-1}(A) \to \cdots$$

If $f:(X,A)\to (Y,B)$ is a map of pairs then we get an **induced map** $f_\#\colon C_*(X)\to C_*(Y)$ defined by

$$(\sigma \colon \Delta^n \to A) \mapsto f \circ \sigma.$$

Observe that $f_{\#}(C(A)) \subset C_{*}(B)$ and so $f_{\#}$ descends to a map

$$f_{\#} \colon C_{*}(X)/C_{*}(A) \to C_{*}(Y)/C_{*}(B)$$

or equivalently $f_{\#} \colon C_{*}(X,A) \to C_{*}(Y,B)$ this then induces $f_{*} \colon H_{*}(X,A) \to H_{*}(Y,B)$.

Proposition 1.4.11 (Homotopy invariance). If $f, g: (X, A) \to (Y, B)$ are homotopic as maps of pairs then $f_* = g_*: H_*(X, A) \to H_*(Y, B)$.

Proof. Let $H: (X \times I, A \times I) \to (Y, B)$ be the homotopy, H induces a chain homotopy $h: C_*(X) \to C_{*+1}(Y)$ where $dh + hd = f_\# - g_\#$. $H(A \times I) \subset B$ so $h(C_*(A)) \subset C_{*+1}(B)$ this implies that h descends to a map

$$h: C_*(X)/C_*(A) \to C_{*+1}(Y)/C_{*+1}(B)$$

with $hd+dh=f_\#-g_\#$ as any relation satisfied will remain satisfied in the quotient. So we have $h\colon C_*(X,A)\to C_{*+1}(Y,A)$ and hence $f_\#,g_\#\colon C_*(X,A)\to C_*(Y,B)$ are chain homotopic. \square

1.4.2.1 Visualising relative homology classes

If W^{n+1} is a connected oriented compact manifold then we'll show that $H_{n+1}(W, \partial W) \cong \mathbf{Z} = \langle [W, \partial] \rangle$ (where the ∂ notation means relative to boundary). So given $f: (W, \partial) \to (X, A)$ we get $f_*([W, \partial W]) \in H_{n+1}(X, A)$.

Example 1.4.12. Let $X = \mathbb{R}^3$ and $A = S^1$ then $W = D^2$ defines a class in $H_2(\mathbb{R}^3, S^1)$ (the boundary of W lies inside of A).

1.4.3 Good pairs

Definition 1.4.13 (Good pair). (X, A) is a **good pair** if

- 1. $\exists U \subset X$ open and $A \subset U$
- 2. $\exists \pi : U \to A \text{ with } \pi|_A = \mathrm{id}_A.$
- 3. $\pi \sim 1_{(U,A)}$ as maps of pairs from (U,A) to itself.

(i.e. A is a deformation retract of U).

Example 1.4.14 (Good pairs). 1. (smooth manifold, closed submanifold).

2. (simplicial complex, subcomplex).

Example 1.4.15 (Not good pairs). 1. (\mathbf{R}, \mathbf{Q}) .

2. Letting $H \subset \mathbf{R}^2$ be the Hawaiian earring then (\mathbf{R}^2, H) is not a good pair.

Theorem 1.4.16. Take $A \subset X$ and let π be the natural map $\pi : (X, A) \to (X/A, A/A) \cong (X/A, *)$. Then if (X, A) is a good pair the induced map $\pi_* : H_*(X, A) \to H_*(X/A, *)$ is an isomorphism.

Exercise 1.4.17. The composite map ϕ in

$$\tilde{H}_*(X) \to H_*(X) \to H_*(X,*)$$

is an isomorphism. i.e.

$$H_*(X,*) = \begin{cases} H_*(X), & * > 0, \\ H_0(X)/\mathbf{Z}, & * \le 0. \end{cases}$$

Proposition 1.4.18.

$$\tilde{H}_*(S^n) = \begin{cases} \mathbf{Z}, & * = n, \\ 0, & * \neq n. \end{cases}$$

Proof. We proceed by induction on n. For n=0 we have $S^0=\{p_+,p_-\}$ implying

$$H_*(S^0) = H_*(p_+) \oplus H_*(p_-) = \begin{cases} \mathbf{Z}^2, & * = 0, \\ 0, & * \neq 0, \end{cases}$$

giving

$$\tilde{H}_*(S^0) = \begin{cases} \mathbf{Z}, & * = 0, \\ 0, & * \neq 0. \end{cases}$$

Now consider the long exact sequence of the pair (D^n, S^{n-1})

$$H_*(D^n) \to H_*(D^n, S^{n-1}) \to H_{*-1}(S^{n-1}) \xrightarrow{\phi} H_{*-1}(D^n),$$

we can break this up using the kernel and cokernel to get

$$0 \to \operatorname{coker} \phi_m \to H_m(D^n, S^{n-1}) \to \ker \phi_{m-1} \to 0. \tag{1.4.1}$$

 \mathbb{D}^n is contractible and so we get

$$H_*(D^n) = \begin{cases} \mathbf{Z}, & * = 0, \\ 0, & * \neq 0. \end{cases}$$

We have $\phi: H_0(S^{n-1}) \to H_0(D^n) \cong \mathbf{Z} = \langle e_p \rangle$ given by $\phi(e_p) = e_p$. We see that $\ker \phi = \tilde{H}_*(S^{n-1})$ and $\operatorname{coker} \phi = 0$. Now by looking at (1.4.1) we see that

$$0 \to \tilde{H}_*(S^n) = H_*(S^n, *) = H_*(D^n, S^{n-1}) \to \ker \phi = \tilde{H}_*(S^{n-1}) \to 0$$

is exact giving $\tilde{H}_*(S^n) \cong \tilde{H}_*(S^{n-1})$. The claim then follows by induction. \square

Corollary 1.4.19.

$$S^n \sim S^m \implies m = n$$

Example 1.4.20 (Chains generating $H_n(S^n,*)$). 1. Choose $f: \Delta^n \to \Delta^n$ a homeomorphism and let $e: \Delta^n \to \Delta^n$ be the identity map. Then $a_{n-1} = f_\#(de) \in C_*(S^{n-1})$ and we have $da_{n-1} = df_\#(de) = f_\#(d^2e) = 0$ and so a_{n-1} is closed.

2. Choose $g: (D^n/S^{n-1}, S^{n-1}/S^{n-1}) \to (S^n, *)$. Now let $b_n = g_\#(f_\#(e)) \in C_n(S^n, *)$. Then $db_n = g_\#(a_{n-1}) \in C_*(*)$ implies b_n is closed in $C_*(S^n, *)$. For example if n = 2 we are crushing the boundary of the 2-simplex to a point.

Proposition 1.4.21. $[a_n]$ generates $\tilde{H}_n(S^n) = \mathbf{Z}$ (statement (A_n)). $[b_n]$ generates $\tilde{H}_n(S^n, *) = \mathbf{Z}$ (statement (B_n)).

Proof. Statement (A_0) : $S^0 = \{p_+, p_-\}$, $de = e_{p_+} - e_{p_-}$ so de generates $\tilde{H}_0(S^0)$. We'll show that $A_{n-1} \Longrightarrow B_n$. Here $\partial \colon H_n(S^n, *) = H_n(D^n, S^{n-1}) \xrightarrow{\sim} \tilde{H}_{n-1}(S^{n-1})$ (by 1.4.18). So it suffices to check that $\partial [b_n] = [a_{n-1}]$

Definition 1.4.22 (Wedge product). If (X_i, p_i) are pointed spaces the **wedge** product

$$\bigvee_{i \in I} (X_i, p_i) \text{ is } \coprod_{i \in I} X_i / \{p_i : i \in I\}.$$

If X_i is such that for any $p, q \in X_i$ there exists a homeomorphism $f: X_i \to X_i$ with f(p) = q we can drop p_i from the notation (for example in the case of X_i a connected manifold we can do this).

Example 1.4.23.

Corollary 1.4.24. If (X_i, p_i) are good pairs then

$$\tilde{H}_*\left(\bigvee_i(X_i,p_i)\right) = \bigoplus_i \tilde{H}_*(X_i).$$

Proof.

$$\tilde{H}_* \left(\bigvee_{i \in I} X_i \right) \cong H_* \left(\bigvee_{i \in I} X_i, p \right) \cong H_* \left(\coprod_{i \in I} X_i, \{ p_i : i \in I \} \right)$$
$$\cong \bigoplus_{i \in I} H_* \left(X_i, p_i \right) \cong \bigoplus_{i \in I} \tilde{H}_* (X_i).$$

Example 1.4.25.

$$H_*(S^1 \vee S^2) = \begin{cases} \mathbf{Z}, & * = 0, 1, 2\\ 0, & \text{otherwise.} \end{cases}$$

1.5 Subdivision and Excision

Definition 1.5.1. If $\mathcal{U} = \{U_i\}_{i \in I}$ is an open cover of X, let

$$C_n^{\mathcal{U}}(X) = \langle e_{\sigma} : \sigma : \Delta^n \to X, \text{ im } \sigma \subset U_i \text{ for some } i \rangle \subset C_n(X).$$

Observe that im $\sigma \subset U_i$ implies im $\sigma \circ F_j \subset U_i$ and so $C_*^{\mathcal{U}}$ is a subcomplex of C_* . Let $H_*^{\mathcal{U}}$ be the homology of this complex, then we have a map

$$i: C^{\mathcal{U}}(X) \hookrightarrow C_{*}(X).$$

Lemma 1.5.2 (Subdivision). $C_*: H_*^{\mathcal{U}}(X) \to H_*(X)$ is an isomorphism.

1.6 Degree and Orientations

1.7 Cell Complexes

Definition 1.7.1 (Attaching of cells). If $f: S^{n-1} \to X$ then

$$X \cup_f D^n = X \coprod D^n / \sim$$

is the space obtained by **attaching** an n-dimensional cell to X via the map f.

Example 1.7.2. If $X = \{p\}$ and $f: S^{n-1} \to X$ then

$$X \cup_f D^n \cong D^n/S^{n-1} \cong S^n$$
.

Definition 1.7.3 (Finite cell complex). A 0-dimensional **finite cell complex** is a finite disjoint union of points.

A k-dimensional finite cell complex is a space obtained by attaching finitely many k-cells to a (k-1)-dimensional finite cell complex.

Example 1.7.4.

Example 1.7.5. If a finite cell complex X has one 0-cell and one n-cell then $X \cong S^n$. Similarly if X has one 0-cell and kn-cells then $X \cong \bigvee_{i=1}^k S^n$.

Example 1.7.6. T^2 is a finite cell complex with one 0-cell, two 1-cells and one 2-cell.

Example 1.7.7. Any simplicial complex is a finite cell complex and any closed manifold can be given the structure of a finite cell complex.

Chapter 2

Cohomology and Products

2.1 Homology with Coefficients and Cohomology

2.1.1 Hom and \otimes for modules

Definition 2.1.1 (Tensor product of R-modules). Let M, N be R-modules. Then the **tensor product** $M \otimes N$ is the R-modules generated by all pairs $m \otimes n$ for $m \in M, n \in N$ modulo the relations:

- 1. $(m_1 + m_2) \otimes (n_1 + n_2) = \sum m_i \otimes n_j$.
- 2. $r(m \otimes n) = (rm) \otimes n = m \otimes (rn)$.

We have the following properties of this definition:

- 1. $(M_1 \oplus M_2) \otimes (N_1 \oplus N_2) = \bigoplus M_i \otimes N_i$.
- 2. $M \otimes N \cong N \otimes M$.
- 3. $M \otimes R = M$

Example 2.1.2 (Tensor products). 1. $R^n \otimes R^m \cong R^{mn}$.

- 2. Letting $R = \mathbf{Z}$, $\mathbf{Q} \otimes \mathbf{Z} / a \cong 0$.
- 3. $\mathbf{Z}/a \otimes \mathbf{Z}/b \cong \mathbf{Z}/(a,b)$.

If $f: M_1 \to M_2$ and $g: N_1 \to N_2$ then there is a map

$$f \otimes g \colon M_1 \otimes N_1 \to M_2 \otimes N_2,$$

 $m \otimes n \mapsto f(m) \otimes g(n).$

Example 2.1.3. If $f: \mathbb{R}^n \to \mathbb{R}^m$ is given by multiplication by $A \in \operatorname{Mat}_{n \times m}(\mathbb{R})$ then $f \otimes 1_M \colon M^n \to M^m$ is given by multiplication by A.

Definition 2.1.4 (Hom).

$$\operatorname{Hom}(M,N) = \{f \colon M \to N : f \text{ is } R\text{-linear}\}\$$

is an R-module, via (f + rg)(m) = f(m) + rg(m).

From this definition we see that

- 1. $\operatorname{Hom}(\bigoplus M_i, \bigoplus N_j) \cong \bigoplus_{i,j} \operatorname{Hom}(M_i, N_j)$.
- 2. $\operatorname{Hom}(R, M) \cong M$.

Note however that we do not have $\operatorname{Hom}(M,N)=\operatorname{Hom}(N,M)$ as for example $\operatorname{Hom}(\mathbf{Z}/2,\mathbf{Z})=0$ but $\operatorname{Hom}(\mathbf{Z},\mathbf{Z}/2)=\mathbf{Z}/2$.

Definition 2.1.5 (Dual module). Given an R-module M the **dual** of M is $M^* = \text{Hom}(M, R)$.

Now if we have $f: M \to N$ we get a map

$$f^* \colon \operatorname{Hom}(N, O) \to \operatorname{Hom}(M, O)$$

given by $f^*g = g \circ f$.

Example 2.1.6. If $f: \mathbb{R}^n \to \mathbb{R}^m$ is multiplication by A then

$$f^* \colon \operatorname{Hom}(\mathbb{R}^m, O) \cong O^m \to \operatorname{Hom}(\mathbb{R}^n, O) \cong O^n$$

is multiplication by A^{\top} .

2.1.2 Hom and \otimes for chain complexes

If (C, d) is a chain complex defined over R then so are $(C_* \otimes M, d \otimes 1_M) = C_* \otimes M$ and $(\text{Hom}(C_*, M), d^*) = \text{Hom}(C_*, M)$.
